

## LISTING OF THE CLAIMS

Claims 1-3 (canceled).

4 (currently amended): In a method for producing a thick grain-oriented electrical steel sheet with excellent properties, the method comprising:

preparing a slab ~~comprising~~ consisting essentially of, by weight, 0.025 - 0.075% of C, 2.5 - 4.5% of Si, 0.025 - 0.035% of acid soluble Al, 0.0060 - 0.0086% of N, 0.070 - 0.161% of Mn, 0.005 - 0.029% of S, one or more elements selected from the group consisting of Se, Sb, Cu, Nb, Cr, Sn, Ti and Bi, and the balance being iron and unavoidable impurities;

heating the slab to a temperature not higher than 1,300°C, hot rolling the slab to a hot-rolled sheet, optionally annealing the hot-rolled sheet,

cold rolling the hot rolled sheet to a cold-rolled sheet by a reduction ratio of not less than 80% by using a one stage cold rolling or two or more stages of cold rolling with intermediate annealing,

said cold rolling providing the sheet with a final thickness of 0.36 - 1.00 mm,

decarburization annealing the cold-rolled sheet for decarburization of the sheet at a temperature of 700 - 1,000°C,

treating the cold-rolled sheet for nitriding by using NH<sub>3</sub> gas, and final annealing,

~~wherein the improvement comprising the sheet having a final thickness of 0.36 to 1.00 mm,~~

setting C-content to not greater than 0.0050% by weight after decarburization annealing of the sheet,

setting total N-content to 0.010 - 0.027% by weight after nitriding treatment of the sheet in  $\text{NH}_3$  gas following said decarburization annealing,

coating the nitrided sheet with an annealing separation agent consisting essentially of  $\text{MgO}$  and subjecting the coated sheet to final annealing as a coil having a coil inside diameter within a range of 200 - 1500 mm to obtain grains of a selected diameter, its grains of a diameter exceeding 5 mm having a crystal orientation deviation ( $\Delta\theta$ ) of 0.2 - 4 degrees in relation to that at the grain center, and a post-final-annealing SF value of less 0.80, where SF is defined as

$$\text{SF} = (\text{grain area} \times 4\pi) / (\text{grain boundary length})^2,$$

whereby a magnetic flux density  $B_8$  of the sheet is not less than 1.83T and core loss  $W_{17/50}$  (w/kg) of the sheet is not more than  $3.3 \times t + 0.35$ .

5 (previously presented): The method according to claim 4, comprising:

final annealing the coil adjusted to a coil inside diameter of 600 mm.

6 (previously presented): The method according to claim 4, comprising:

decarburization annealing of the cold-rolled sheet for 120 seconds to 250 seconds at  $800^\circ\text{C}$  to  $900^\circ\text{C}$  in an atmosphere of 25%  $\text{N}_2$ , 75%  $\text{H}_2$  with a dew point of  $60^\circ\text{C}$  to  $75^\circ\text{C}$ ; and

following said decarburization annealing,  
subjecting the sheet to nitriding treatment for 10 to 60  
seconds at 700°C to 900°C in an atmosphere of dry NH<sub>3</sub> gas.
